

Market evidence & early validation

How Metrigo is being proven in the field today: by a founder who still runs construction projects, a small circle of early operators, and one active project on the live product.

Early-stage validation — not scaled commercial traction

This page is for evaluators. We do not invent company names, paying-customer counts, or growth charts. What follows is the real circle of use and feedback as of now — early validation and design partners, not a claim of market scale.

Founder as active user

Metrigo is built by someone who lives the same workflows the product serves. For about ten years the founder has worked across residential and commercial projects in three roles — so product ideas come from the field, not from slides alone.

- Investor on construction projects.
- Supervising engineer (مهندس ناظر) — formal oversight of build quality and compliance.
- Project supervisor / superintendent — day-to-day delivery across many sites.

The gaps before Metrigo

Nobody else around the founder felt these field gaps the same way — which is why he is best placed to drive Metrigo's product direction as a builder, construction project manager, and site supervisor who still uses the tool himself.

- Information fragmentation across notebooks, spreadsheets, chat, and paper.
- Manual and paper-heavy processes that break when several projects run at once.
- Repetitive hand-built statistics and reporting with little reuse.
- Weak real-time control when supervising multiple projects in parallel.

What Metrigo already covers

On the founder's own work, Metrigo addresses a major share of those gaps — from financial and accounting issues through progress supervision and owner communication. The founder's estimate: about 70% of the previous problems and blind spots are now handled in the product.

From money to progress

Project finance, unit/sales context, and progress oversight sit in one operating loop instead of scattered files.

Owner communication

Updates for owners and stakeholders without rebuilding the same report from scratch every week.

Early operators & feedback circle

Beyond the founder and his spouse — who design and build the product together — four people are currently reviewing and using Metrigo. They help find issues and give practical feedback. Roles in that circle:

- Project supervisors.
- Architect / designer.
- Builder and investor perspectives.

Frame this honestly: early validation and design partners — not “X paying customers.” We do not list company names or commercial deal counts here.

Current live usage

One live construction project is currently being run with Metrigo. That is the active operating proof today — useful and real, and still early.

Where we intend to offer Metrigo

Primary focus is the international market. The product is meant to serve builders in Iran and in Europe — same core software, bilingual interface, field-first workflows. Ambition is geographic reach; traction claims stay limited to what is true above.

In one list

- Founder is an active user with ~10 years across investor, supervising engineer, and project superintendent roles.
- Pain was fragmentation, paper/manual work, repetitive reporting, and weak multi-project control.
- Founder estimates ~70% of those gaps are addressed — finance through progress and owner updates.
- Early circle: founders (founder + spouse) plus four reviewers/operators in supervisor, architect/designer, builder, and investor roles.
- One active project on Metrigo today; intent to offer in Iran and Europe — no inflated customer metrics.
