

THE DAILY MESS ON MID-SIZE BUILDS

Units, buyers, and money live in three different places.

On mid-size residential and commercial projects, the pre-sale → build → handover loop still runs across spreadsheets, chat threads, and paper. The people who need answers lose hours stitching them together.

- Unit status, buyers, and installment schedules sit in Excel, messaging apps, and notebooks — rarely in one calm view.
- Site teams need tools that still work when connectivity is weak.
- Owners ask for progress; the full ledger has to stay private.
- Generic CRMs track contacts. Heavy construction suites chase job-site logistics. Neither owns the unit + installment + site-finance reality of mid-size developers.

ONE OPERATING LOOP

A bilingual field app for units, money, and owners.

Metrico is a live SaaS / PWA built for that loop — so a developer or site supervisor can see sold units, what is owed, and what an owner can safely see, without rebuilding the same report every week.

- Visual floor / unit map: sold, reserved, vacant — not only tables.
- Contract math from $m^2 \times$ price, remaining debt, average sale price per m^2 .
- Installments, project costs, investor shares, check & cash reports, PDF exports.
- Owner portal with a progress gallery — updates without exposing the books.
- Installable offline-capable PWA for weak-signal sites. English and Persian by design.

WORKING SOFTWARE

Live product. Four plans. Ready to demo.

Metrico is not a concept deck. The app is in production for demos and onboarding — bilingual, field-oriented, with labeled sample data so evaluators can walk the full path.

What you can open today

- Unit grids and sales context
- Installments and project finance
- Owner portal + progress gallery
- PDF reports for partners and accountants
- Offline sync on installable PWA

Higher tiers unlock more depth

- Inventory and tax-prep path (Pro)
- Contracts, progress statements, QC (Pro)
- Takeoff and building energy tools (Ark)
- In-app drawings and map exports
- Rule-based assistant on your project data

Demo account: demo@metrico.app (password from founders). Sample data is labeled demo — not paying traction.

EARLY VALIDATION — HONEST

Built by someone who still runs the workflow.

We do not invent logos or paying-customer charts. What we have today is founder-as-user proof, a small feedback circle, and one live project on the product.

Founder in the field

~10 years across investor, supervising engineer, and project superintendent roles. Product ideas come from sites, not from slides alone.

~70% of the old gaps

On the founder's own work, Metrico already covers about seventy percent of the previous blind spots — finance through progress and owner updates.

Small circle + one project

Founder and spouse build together; four operators review (supervisors, architect/designer, builder, investor). One active construction project runs on Metrico today.

Frame: early validation and design partners — not scaled commercial traction.

YEAR-1 EFFORT WEIGHTS

Where we spend attention — not a revenue split.

These percentages are planning assumptions for time and focus in Year 1. They are not a claimed revenue share by country.

~30% effort**Iran**

Familiar operating market: language, relationships, and field workflows we already know. Useful for product feedback and early operators.

~50% effort**Estonia**

Company base, technical hiring, first pilots, denser feedback. Beachhead for learning how to sell into the EU.

~20% effort**Other markets**

Selective later European outreach after the Estonia anchor is working — not a spray of regional claims.

ICP: builders / developers, contractors, technical offices and site supervisors. Grow through product strength and field referrals.

ANNUAL SAAS

Start free. Upgrade when the portfolio needs more.

Metrico sells software subscriptions on annual prepaid plans — not custom agency rebuilds per project. Primary revenue is paid upgrades.

Starter**Free**

1 project · core tools

Plus**€50 / year**

More projects · sales & reports

Pro**€100 / year**

Inventory · tax prep · deeper finance

Ark**€150 / year**

Takeoff · energy · unlimited projects

EU card billing is under development. Iran checkout path exists. Unit economics on the revenue sheet are early model assumptions — not live KPI dashboards.

WHY OPERATORS REACH FOR IT

The Swiss-army knife for the construction site.

Not a slogan factory. When units, money, and owners collide on one project, mid-size teams need one calm tool — not three half-fitted systems and a spreadsheet that never quite matches.

- All-in-one site ops for the pre-sale → handover money loop: visual unit grids, installment math, site finance, owner updates.
- Construction-native objects out of the box — floors, units, sale status, installments, ledgers, PDF reports — instead of forcing a generic CRM to pretend it knows a unit map.
- Field-first delivery: bilingual UI, offline-capable PWA, owner-safe sharing without opening the full books.
- Depth when needed: drawings in-app, maps with market signal, contracts & QC, takeoff and energy on higher plans.

Positioning in one line: credible field utility for mid-size construction — not a gimmick brand.

DIRECTIONAL PLAN

Beachhead first. Then careful European reach.

High-level map only — founder planning assumptions, not promised conversion rates or invented pipeline.

Next 90 days

- One industry exhibition
- In-person meetings with construction firms
- Site and workshop visits
- Supervisor talks to seed referrals

Year 1

- Iran + Estonia dual focus (effort weights)
- ~30–60 early users as an adoption assumption
- Discount + referral mechanics for early operators
- Company base and local validation in Estonia

Year 2–3

- EU industry platforms where buyers look
- Marketing partners where fit is real
- Direct outreach to notable firms
- Ongoing competitor gap analysis — product-led

Thesis: a power-user site supervisor refers peers more credibly than cold ads.

REAL BASE, LEAN OPS

Estonia as company home — not a paper HQ.

We intend a serious Estonian presence: digital infrastructure, EU legal foothold, and a demanding environment that surfaces product weaknesses early.

Planned sequence

- Initiate e-Residency in parallel with committee prep
- Register the company after committee approval
- Complete e-Residency + company setup before relocation
- Relocate with family after the current home-country construction project finishes

Year-1 presence model

- Hire one developer in Estonia
- Start from home / residence; office later only if the team grows
- Run Metrico locally for beachhead validation
- Year-1 living + GTM budget assumption: €40,000

€40k covers residence for founder, spouse, and two children, plus early marketing / exhibitions. Planning assumption — not a grant claim. e-Residency and company registration are not claimed as complete today.

FROM THE FOUNDER

I built this because the gap was mine first.

I have spent years on sites as investor, supervising engineer, and project superintendent. Metrico is the tool I needed when notebooks, spreadsheets, and chat failed me — and I still run a live project on it. Roughly seventy percent of those old blind spots are already gone on my own work. That is not a market-size claim. It is a builder's proof that the product earns its keep.

I am asking the Startup Committee to review Metrico as an Estonian / EU SaaS company in formation: recognition to register, hire one engineer, and operate from Estonia with a lean year-one plan. A working demo is available today — product evidence before paperwork claims.
